

Design Your Own Web App

The code we have been working with recently is especially suited to joining people to data without storing any PII(?) in your app.

- Todo Lists
 - Fitness Trackers
 - Collection trackers
 - Want / Shopping lists
-

Do you have a hobby?

You you collect things or track a team or band?

What?

- What problem would you like to solve.
- What do you want to record, calculate, map or workout?
- <https://tinyurl.com/OLPProjectIdeas>

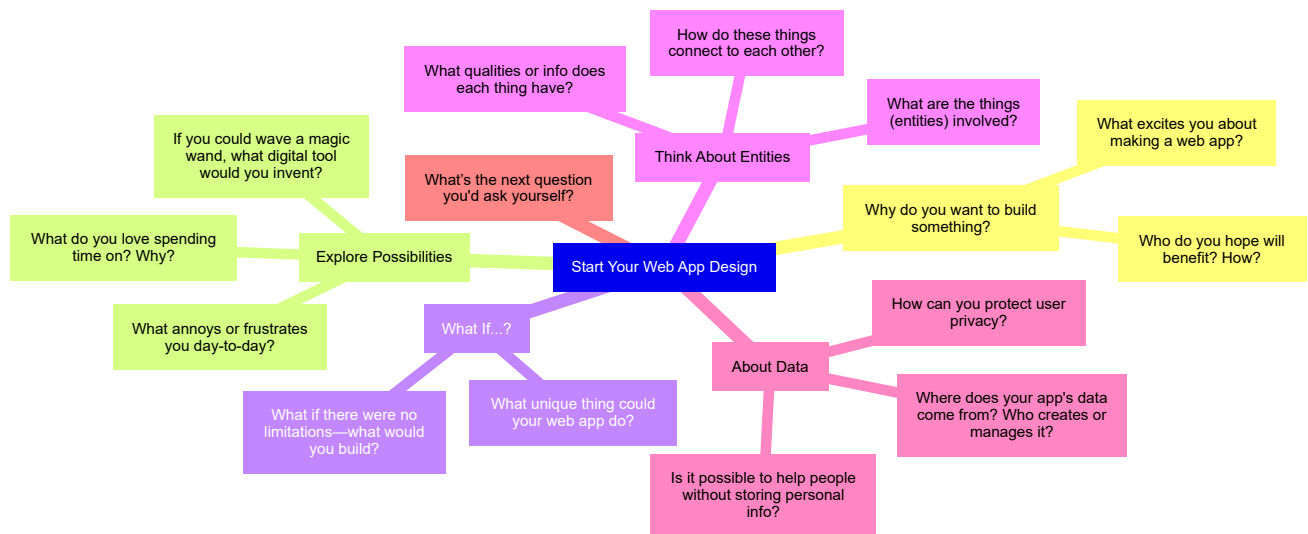

Write it down

Entities

- What **things/entities** are in that?
 - What properties do they have
 - Who has that information?
-

Mind Mapping Might Help

<https://tinyurl.com/WebAppMindMap>

Planning

What is in a plan for a piece of software?

Decide on a name & simple design

- **Name** What is it called?
 - **Purpose** What is it for?
 - What problem are you trying to solve?
 - Who needs it and what are there needs?
 - **Success Criteria** What does Success look like?
 - How will you know it works?
 - **Analysis**
 - **Entities** What thing will you store info about?
 - **Inputs, Outputs, Processing & Storage?**
-

Talk to sir to check it.

Commit & Push Your todo-app

Fork your todo-app

- Use Github Desktop to get you new project locally
- Copy the .env file from your Todo app

- Run it and you should see the Todo App working
 - Commit & Push it and add the link to the Assignment in Teams
-

Start changing the names

- Classes, functions and variables can be changed with F2
- Change the variables in the templates and everything else to match
- Talk to each other about what breaks
